

# Medium Power Film Capacitors

## FFHV/FTHV 1500Vdc to 3000Vdc

The FFHV and FTHV series are specifically designed for DC filtering applications such as DC link or resonant filters for voltages up to 3000V.

These capacitors are proposed in 2 different versions: resin top for the FFHV series and hermetic case for the FTHV.

Large case sizes up to 36 liters and high specific energy up to 380J/l together with safe and reliable Controlled Self Healing Technology make this series particularly suitable for power converters in traction, drives, renewable energy and power transmission areas.

FFHV and FTHV use a wet solution with polypropylene metallized film and oil (without free oil). Standard designs proposed in this catalogue are covering a wide range of voltage and capacitance values.

In case of specific requirements about shape and performances, feel free to contact your local AVX representative.

### PACKAGING MATERIAL

#### FFHV

Non-painted rectangular resin filled aluminium case  
Mounting brackets  
M8/17 female connections or M12/30 male connections  
2 or 4 connections

#### FTHV

Non-painted rectangular aluminium hermetic case  
Mounting brackets  
M8/17 female terminals or M12/30 male terminals  
2 or 4 terminals

### STANDARDS

#### FFHV

IEC 61071: Power electronic capacitors  
IEC 61881: Railway applications, rolling stock equipment, capacitors for power electronics  
IEC 60068-2: Environmental testing  
UL 94: Fire requirements  
NF F 16-101: Rolling stock – Fire behaviour – Materials choosing  
NF F 16-102: Rolling stock – Fire behaviour – Materials choosing, application for electric equipments  
EN 45545-2: Railways applications – Fire protection on railway vehicles. Part 2: Requirements for fire behaviour of materials and components

#### FTHV

IEC 61071: Power electronic capacitors  
IEC 61881: Railway applications, rolling stock equipment, capacitors for power electronics  
IEC 60068-2: Environmental testing  
EN 45545-2: Railways applications – Fire protection on railway vehicles. Part 2 : Requirements for fire behaviour of materials and components

# Medium Power Film Capacitors

FFHV/FTHV 1500Vdc to 3000Vdc

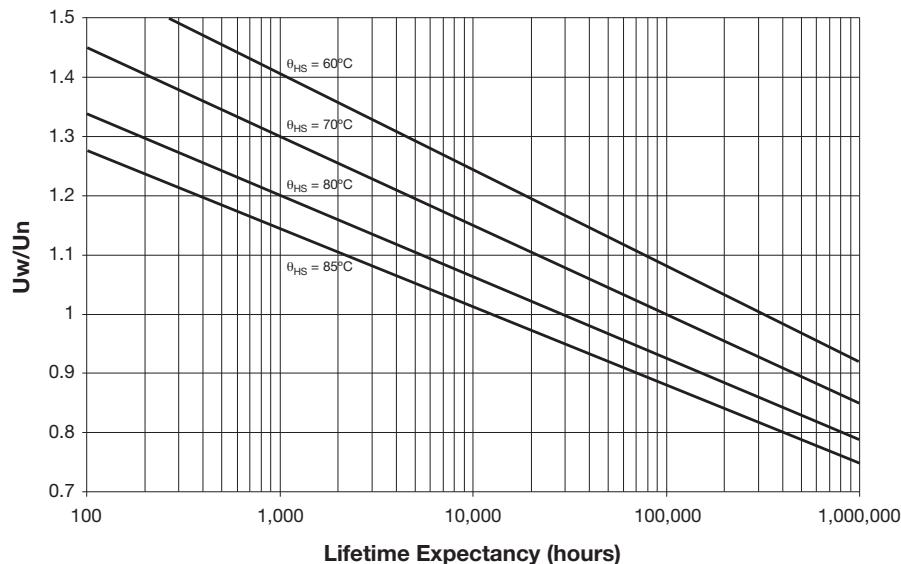

## DEFINITIONS

<b>C<sub>n</sub></b> ( $\mu\text{F}$ )	capacitance	nominal value of the capacitance measured at $\theta_{\text{amb}} = 25 \pm 10^\circ\text{C}$
<b>U<sub>n</sub></b> (V)	rated DC voltage	maximum operating peak voltage of either polarity (non-reversing type waveform), for which the capacitor has been designed for continuous operation
<b>U<sub>w</sub></b> (V)	working voltage	value of the maximum operating recurrent voltage for a given hot spot temperature and an expected lifetime
<b>U<sub>r</sub></b> (V)	ripple voltage	peak-to-peak alternating component of the unidirectional voltage
<b>L<sub>s</sub></b> (nH)	parasitic inductance	capacitor series self-inductance
<b>R<sub>s</sub></b> (m $\Omega$ )	series resistance	capacitor series resistance due to galvanic circuit
<b>I<sub>rms</sub></b> (A) Thermal 1	RMS current	rms current value @ 100Hz for continuous operation under natural convection generating 20°C overheating (255A <sub>rms</sub> maximum for 2 connexions or terminals and 400Arms maximum for 4 connexions or terminals)
<b>I<sub>rms</sub></b> (A) Thermal 2	RMS current	rms current value @ 100Hz for continuous operation under forced air generating 20°C overheating (255A <sub>rms</sub> maximum for 2 connexions or terminals and 400Arms maximum for 4 connexions or terminals)
<b><math>\theta_{\text{amb}}</math></b> (°C)	cooling air temperature	temperature of the cooling air measured at the hottest position of the capacitor, under steady-state conditions, midway between two units <small>NOTE If only one unit is involved, it is the temperature measured at a point approximately 0.1 m away from the capacitor container and at two-thirds of the height from its base</small>
<b><math>\theta_{\text{HS}}</math></b> (°C)	hot spot temperature	highest temperature obtained inside the case of the capacitor in thermal equilibrium

## CHARACTERISTICS

Capacitance range C <sub>n</sub>	590 $\mu\text{F}$ to 12600 $\mu\text{F}$
Tolerance on C <sub>n</sub>	$\pm 10\%$
Rated DC voltage U <sub>n</sub>	1500 to 3000V
Lifetime at U <sub>n</sub> and 70°C hot-spot temperature and $\Delta C / C < 2\%$	100,000h
Parasitic inductance L <sub>s</sub>	27nH to 88nH
Maximum rms current I <sub>rms</sub>	up to 400A <sub>rms</sub>
Test voltage between terminals @ 25°C	1.5 x U <sub>n</sub> for 10s
Test voltage between terminals and Case @ 25°C	7kV <sub>rms</sub> @ 50Hz for 10s
Dielectric	polypropylene
Climatic Category	40 / 85 / 56 (IEC 60068)
Working temperature	-40°C / +85°C (according to the power dissipated)
Storage temperature	-40°C / +85°C
Calorific value	34 MJ/kg

## LIFETIME EXPECTANCY VS HOT SPOT TEMPERATURE AND VOLTAGE

# Medium Power Film Capacitors

FFHV/FTHV 1500Vdc to 3000Vdc

## HOW TO CHOOSE THE RIGHT CAPACITOR

The capacitor lifetime depends on the working voltage and the hot spot temperature.

Our caps are designed to meet 100000 hours lifetime at rated voltage and 70°C hot spot temperature. In accordance with operating conditions, please calculate the hot spot temperature and deduce from this calculation if the obtained lifetime can suit the application.

### 1. From the tables, select a capacitor with required capacitance $C_n$ and voltage $U_n$ .

Calculate the maximum ripple voltage allowed for the selected cap:

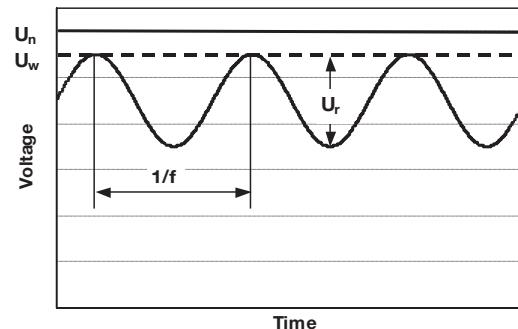

$$U_{\max} = 0.2U_n$$

If  $U_r > U_{\max}$ , select a capacitor with higher rated voltage

Make sure  $I_{rms}$  application <  $I_{rms}$  table

Copy out:

- serial resistance ( $R_s$ ): see table of values
- thermal resistances  $R_{th1}$  and  $R_{th2}$  (depending on cooling conditions)

### 2. Hot spot temperature calculation

Total losses are calculated as follow:  $P_t = P_j + P_d$

Joule losses:  $P_j = R_s \times I_{rms}^2$

Dielectric losses:  $P_d = Q \times \operatorname{tg}\delta\theta$  with

- $Q(\text{reactive power}) = \frac{I_{rms}^2}{C\omega}$  for a sinusoidal waveform

- $\operatorname{tg}\delta\theta = 2 \times 10^{-4}$  (dielectric losses of polypropylene)

Hot spot temperature will be:

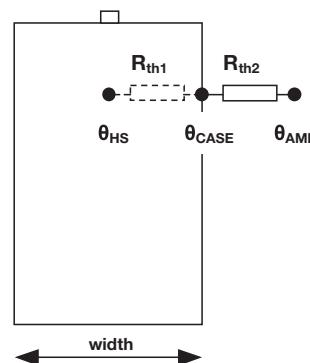

$$\theta_{HS} = \theta_{amb} + (P_j + P_d) \times (R_{th1} + R_{th2})$$

$\theta_{HS}$  **absolute maximum is 85°C**

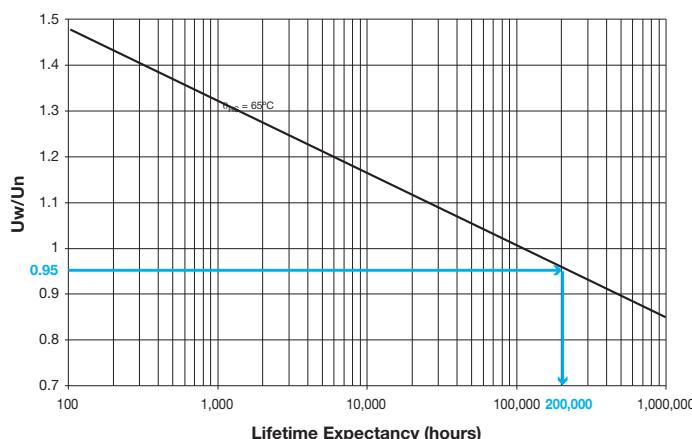

If temperature is higher than 85°C, come back to #1 and start again with another selection.

$R_{th1}$ : thermal resistance between hot spot and case

$R_{th2}$ : thermal resistance between case and ambient air

### 3. Refer to the curve and deduce the lifetime vs $U_w/U_n$ ratio

eg: rated voltage 2000V  
working voltage 1900V  
 $\rho = 0.95 \Rightarrow$  lifetime 200,000 hours  
@ 70°C hot spot temperature

Please, find a calculation form at the end of the catalog

# Medium Power Film Capacitors

FFHV/FTHV 1500Vdc to 3000Vdc

## THERMAL RESISTANCES

$R_{th1}$  (°C/W): Thermal resistance between hot spot and case

R <sub>th1</sub> (°C/W)		
Height (mm)	Width (mm)	
	125	175
230/240	0.40	0.41
295/305	0.33	0.36
370/380	0.27	0.30
450/460	0.22	0.26
530/540	0.19	0.22
610/620	0.17	0.19

$R_{th2}$  (°C/W): Thermal resistance between case and ambient air under natural convection and forced air

Height (mm)	R <sub>th2</sub> (°C)			
	Natural air cooling		Forced air cooling >2m/s	
	Width (mm)	Width (mm)	Width (mm)	Width (mm)
230/240	0.3	0.26	0.15	0.13
295/305	0.25	0.21	0.13	0.11
370/380	0.2	0.18	0.1	0.09
450/460	0.17	0.15	0.09	0.08
530/540	0.15	0.13	0.08	0.07
610/620	0.13	0.11	0.07	0.06

For confined area, capacitor working in a closed cabinet, a thermal test under real conditions is necessary to evaluate the thermal resistance.

## MTBF CALCULATION

Based on Return Of Experience from the field of more than 30 years, we have established the following relation.

The failure rate  $\lambda_B$  depends on hot spot temperature  $\theta_{HS}$  and charge ratio  $\rho$ .

$$\rho = U_w/U_n$$

$$\lambda_B = 3 \times 10^{2.75(\rho-1)} \times e^{\left(3.2\left(\frac{\theta_{HS}+273}{358}\right)^{30}\right)} \times 10^{-9} \quad \text{in failures/hour}$$

## GENERAL FAILURE RATE

$$\lambda = \lambda_B \times \pi_Q \times \pi_B \times \pi_E \text{ failures/hour} \quad \bullet \quad \pi_Q, \pi_B \text{ and } \pi_E \text{ see following tables}$$

Qualification	Qualification factor $\pi_Q$
Product qualified on IEC61071 and internal qualification	1
Product qualified on IEC61071	2
Product answering on another norm	5
Product without qualification	15

Environment	Environment factor $\pi_E$
On ground (good conditions)	1
On ground (fixed materials)	2
On ground (on board)	4
On ship	9
On plane	15

Environment	Environment factor $\pi_B$
Favorable	1
Unfavourable	5

## MEAN TIME BETWEEN FAILURE (MTBF)

$$MTBF = 1/\lambda \text{ hours}$$

## SURVIVAL FUNCTION

$$N = N_0 \times \exp(-\lambda t)$$

N is the number of pieces still working after t hours.

$N_0$  is the number of pieces at the origin ( $t = 0$ )

## FAILURE MODE

Main failure mode due to AVX's **Controlled Self-Healing Technology** is only losses of capacitance. Thanks to **Controlled Self-Healing** solution to interrupt self-healing process in order to prevent avalanche effect due to polypropylene molecular cracking producing gas and potential explosion in confined box for none **Controlled Self-Healing capacitors**.

## CALCULATION FORM

### SPECIFICATION

Capacitance	C ( $\mu$ F)	
Working voltage	U <sub>w</sub> (V)	
Rms current	I <sub>rms</sub> (Amps)	
Frequency	f (Hz)	
Ripple voltage	U <sub>r</sub> (V)	
Ambient temperature	$\theta_{amb}$ ( $^{\circ}$ C)	
Lifetime @ U <sub>w</sub> , I <sub>rms</sub> and $\theta_{amb}$	hours	
Parasitic inductance	L (nH)	

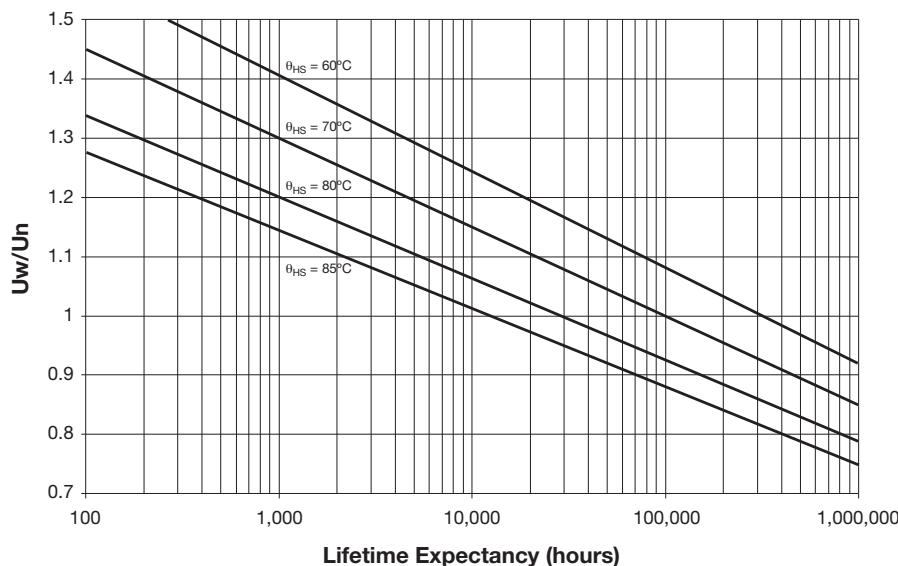

### Your choice

PN	C ( $\mu$ F)	
Capacitance	U <sub>n</sub> (V)	
Rated voltage	R <sub>s</sub> (m $\Omega$ )	
Serial resistance	R <sub>th</sub> ( $^{\circ}$ C/W)	
between hot spot and case		

## CALCULATIONS

Maximum ripple voltage	U <sub>rmax</sub> = 0.2 U <sub>n</sub>	U <sub>rmax</sub> = V
<i>The maximum ripple voltage of the selected capacitor must be in any case higher than the ripple voltage of your application</i>		
Ratio U <sub>w</sub> /U <sub>n</sub>	$\rho = U_w/U_n$	$\rho =$
Joule losses	P <sub>j</sub> = R <sub>s</sub> xI <sub>rms</sub> <sup>2</sup>	P <sub>j</sub> = W
Dielectric losses	P <sub>d</sub> = Qxtg $\delta$ 0=Qx 2.10 <sup>-4</sup>	P <sub>d</sub> = W
Hot spot temperature	$\theta_{HS} = \theta_{amb} + (P_j + P_d) \times R_{th}$	$\theta_{HS} = ^{\circ}$ C
<i>The hot spot temperature must be in any case lower than 85<math>^{\circ}</math>C</i>		

## LIFETIME EXPECTANCY VS HOT SPOT TEMPERATURE AND VOLTAGE

Expected lifetime at hot spot calculated and U = U<sub>w</sub>
